

International Society of Microbiota

International Society of
Microbiota
Towards Clinical Revolution

International Society of Microbiota (ISM) born from the Japanese fermentation “know-how” and its ability to test and validate a scientific solution to aged population. The idea of ISM is to bring a new level of understanding of microbiota science out of the classical existing point of view.

ISM is a non-profit-making international organization. In no case, part of its assets or incomes shall benefit to any private or individual partnership or corporation.

The aims of ISM are to:

1. ISM offer a new perspective and solutions for microbiota and health: the dynamic microbiota research,
2. Advance the practical applications of microbiota and their **metabolites** in all related fields, with particular reference to health and nutrition,
3. Analyse and provide recommendations to ISM's members, health decision makers and institutions about the last microbiota researches, uses and problems. This analysis will be done by international qualified team members of ISM,
4. Transfer the basic researches and data into a real clinical, pharmaceutical and cosmetics applications,
5. Transfer the basic researches and data into a real nutritional and nutraceutical applications in food technology,
6. Encourage communication and interaction among researchers, physicians, nutritionists, industrials, food technology and strategic marketing managers through a global microbiota network,
7. Increase integration and interaction of the various disciplines involved in microbiota fields.

Why an International Society dedicated to Microbiota?

We can divide our task force in four targets:

1. Targeting the Science

More scientific research needed to profile and analyze the diversity of microbiota of each person.

The sequencing of human microbiota progress and many innovations will be presented during Institut Pasteur Meeting.

We look to set up a kind of individual profile to be used as a biomarker of many chronicle diseases.

2. Targeting the Diversity of Population

ISM will take on consideration the variability, the heterogeneity of populations and their diets.

3. Targeting the Industrial Translation

The industrial vision of microbiota must be **re-designed** and re-think.

“...we cannot consider one microbiota strain can treat one precise pathology and fit with all population coming from different cultures...”

We need to reposition the strategy: our task force proposes to analyze the metabolites first, reformulate later and provide it to people **rather than** providing the microbiota strain.

The scientific committee of ISM will double efforts to better understand the quality of metabolite and undertake clinical studies with this metabolite rather the strain.

4. Targeting EFSA regulatory

How to explain the rejection of all claims provided by industries?

The industries and EFSA experts considered the gut microbiota with pharmaceutical frame and strict standard.

While the science of gut and microbiota is a dynamic field, with a huge evolution and affected by multifactor to modulate its functioning.

ISM will bring this new dynamic point of view to accelerate the credible translation of this science into real benefit for the consumer.

A specific meeting with EFSA experts will be scheduled to share our point of view.

ISM offers a new platform connecting industries, scientists and regulatory bodies.

This platform is located in Tokyo.- Japan. The chairman is Yuki Ikeda.

International Society of Microbiota

Dr Yuki Ikeda - Chairman

Kanaya Bldg 4F, 4-11-3, Hatchobori Chuo-ku
104-0032 Tokyo - Japan
